**Program Description:** Throughout QIM's 20-year history, the firm has created and adapted novel ways of using cutting-edge machine learning techniques to build trend-neutral models that seek to forecast market moves over the short-to- medium-term.

QIM operates a pattern recognition strategy designed to identify human behavioral patterns and cognitive biases that are repeatedly embedded within price data. The result: an agglomeration of trend-neutral models that we believe are capable of predicting probable market or security direction over the short- to medium-term.

+ **NOTES:** Net returns for the Quantitative Global Program are calculated assuming 0% management fees and 30% incentive fees for a representative investor since the October 2003 inception of client trading, which reflects the most fees paid by any investor. Returns for each month for the period from 10/1/03 through 6/30/05 were calculated by summing a daily series of aggregate returns for all client managed accounts in the Global Program; the returns series then switches on 7/1/05 to the monthly aggregate for the Quantitative Global Funds at 1X leverage. In addition to the fees referenced above, such returns are shown net of all expenses incurred by the Quantitative Global Funds at 1X leverage. A direct investment in the Global Program returns is not possible; an individual account or particular trading portfolio may have realized more or less favorable results. Information herein that is related to the latest month's performance is based on estimated data.

A Qualified Eligible Person ('QEP') must meet the following two requirements: 1) the investor must first be an accredited investor.
