+ **NOTES:** Previously: From inception of WMA Institutional in Oct 2011 through mid-Jan 2013, the program targeted a 12% annualized volatility. Currently: Beginning Jan 2013, WMA Institutional targets 1/2 the volatility of the WMA Program. In mid-Jan 2013 DUNN's research team implemented a new risk management methodology to replace the previously fixed value at risk ("VaR") target. The new risk management methodology, referred to as the Adaptive Risk Profile ("ARP"), gears the portfolio's VaR to current market conditions. Under ARP, VaR is recalibrated daily based on a proprietary metric that incorporates trend confidence, volatility and market correlations and serves to size WMA's portfolio positions accordingly. VaR at the 99% confidence level is in the range of -11% to -4%, with an average VaR of -8%. This risk management methodology improvement is expected to reduce WMA's downside deviation by about 25%, with no adverse impact on upside performance.
